

Sec 6.3 Jordan Canonical Form (JCF) 3×3 matrices

$T: \mathbb{C}^3 \rightarrow \mathbb{C}^3$ linear

If T is diagonalizable, there exists a basis $\alpha = \{w_1, w_2, w_3\}$ consisting of eigenvectors such that $[T]_{\alpha}^{\alpha} = \begin{bmatrix} \lambda_1 & 0 & 0 \\ 0 & \lambda_2 & 0 \\ 0 & 0 & \lambda_3 \end{bmatrix}$ $\{\lambda_1, \lambda_2, \lambda_3\}$ they don't have to be different eigenvalues

$\alpha = \alpha_1 \cup \alpha_2 \cup \alpha_3$ where $\alpha_i = \{w_i\}$, $1 \leq i \leq 3$

is a canonical basis for \mathbb{C}^3 and $[T]_{\alpha}^{\alpha}$ is the canonical form

What if T is not diagonalizable?

→ Case 1 T has eigenvalues λ with algebraic multiplicity 2, μ , and $\dim(E_{\lambda}) = 1$

Case 2 T has eigenvalue λ with algebraic multiplicity 3.

$$T = \underbrace{T - \lambda I_3}_{\text{nilpotent}} + \lambda I_3$$

$I_n = n \times n$ identity matrix

$$I_3 = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

Claim: $T - \lambda I_3$ is nilpotent

Pf $\det(T - tI_3) = a(t - \lambda)^3$

$$\det((T - \lambda I_3) - tI_3) = \det(T - (\lambda + t)I_3) = a(\lambda + t - \lambda)^3 = at^3 \stackrel{!}{=} 0$$

$\Rightarrow 0$ is only eigenvalue with algebraic multiplicity 3.

$\Rightarrow T - \lambda I_3$ is nilpotent

Since $T - \lambda I_3$ is nilpotent, there exists a canonical basis α for \mathbb{C}^3

such that $[T - \lambda I_3]_{\alpha}^{\alpha}$ is the canonical form

$$\text{Therefore, } [T]_{\alpha}^{\alpha} = [T - \lambda I_3 + \lambda I_3]_{\alpha}^{\alpha} = [T - \lambda I_3]_{\alpha}^{\alpha} + [\lambda I_3]_{\alpha}^{\alpha} = [T - \lambda I_3]_{\alpha}^{\alpha} + \lambda I_3 \quad \text{JCF}$$

Ex1 $T: \mathbb{C}^3 \rightarrow \mathbb{C}^3$ defined by $\begin{bmatrix} 5 & 1 & 1 \\ 0 & 5 & 0 \\ 0 & 0 & 5 \end{bmatrix}$. Find a canonical basis and JCF.

Sol $\lambda = 5$ an eigenvalue with algebraic multiplicity 3.

$$T = \underbrace{T - 5I_3}_{\text{nilpotent}} + 5I_3$$

$$T - 5I_3 = \begin{bmatrix} 0 & 1 & 1 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} \quad \checkmark \text{ a REF}$$

$$\Rightarrow \dim(\ker(T - 5I_3)) = 2 \rightarrow 2 \text{ cycles}$$

A canonical basis for $\mathbb{C}^3 = \{(T - 5I_3)(x), x\} \cup \{w\} \stackrel{!}{=} \alpha$

the canonical form of $T - 5I_3$ is

$$[T - 5I_3]_{\alpha}^{\alpha} = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}$$

$$[T]_{\alpha}^{\alpha} = [T - 5I_3]_{\alpha}^{\alpha} + 5I_3$$

$$= \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} + \begin{bmatrix} 5 & 0 & 0 \\ 0 & 5 & 0 \\ 0 & 0 & 5 \end{bmatrix} = \begin{bmatrix} 5 & 1 & 0 \\ 0 & 5 & 0 \\ 0 & 0 & 5 \end{bmatrix}$$

Case 1 T has eigenvalues λ, λ and μ with $\dim(E_\lambda) = 1$

$$\Phi^3 \neq E_\lambda \oplus E_\mu = \ker(T - \mu I_3)$$

$$\parallel$$

$$\ker(T - \lambda I_3)$$

$$\ker(T - \lambda I_3) \subset \ker((T - \lambda I_3)^2)$$

$$\ker((T - \lambda I_3)^2) \cap \ker(T - \mu I_3) = \{0\}$$

$$\Rightarrow \dim(\ker(T - \lambda I_3)^2) = 2 \quad \text{and} \quad \Phi^3 = \underbrace{\ker((T - \lambda I_3)^2)}_{K_\lambda} \oplus \underbrace{\ker(T - \mu I_3)}_{K_\mu}$$

Def: $K_\lambda = \ker((T - \lambda I)^m)$ where m is the algebraic multiplicity of λ , is called λ -generalized eigenspace of T .

- Facts
- K_λ is invariant, so $T|_{K_\lambda} : K_\lambda \rightarrow K_\lambda$ is linear (the same for $T|_{K_\mu}$)
 - $T|_{K_\lambda} = T|_{K_\lambda} - \lambda I_3 + \lambda I_3$ (the same for $T|_{K_\mu}$)

nilpotent mapping

by case 2

Since $T|_{K_\lambda} - \lambda I_3$ is nilpotent, there exists a canonical basis α_1 for K_λ

$$\text{Such that } [T|_{K_\lambda}]_{\alpha_1}^{\alpha_1} = [T|_{K_\lambda} - \lambda I_3]_{\alpha_1}^{\alpha_1} + \lambda I_2$$

Similarly, since $T|_{K_\mu} - \mu I_3$ is nilpotent, there exists a canonical basis α_2 for K_μ

$$\text{Such that } [T|_{K_\mu}]_{\alpha_2}^{\alpha_2} = [T|_{K_\mu} - \mu I_3]_{\alpha_2}^{\alpha_2} + \mu I_1$$

Let $\alpha = \alpha_1 \vee \alpha_2$. Then α is a canonical basis for Φ^3

$$\text{and } [T]_\alpha^\alpha = \begin{bmatrix} [T|_{K_\lambda}]_{\alpha_1}^{\alpha_1} & \\ & [T|_{K_\mu}]_{\alpha_2}^{\alpha_2} \end{bmatrix} \quad \text{JCF}$$

Jordan blocks

Ex2 $T: \mathbb{C}^3 \rightarrow \mathbb{C}^3$ defined by $\begin{bmatrix} 3 & 1 & 1 \\ 0 & 3 & 0 \\ 0 & 0 & 4 \end{bmatrix}$. Find a canonical basis and JCF

Sol

$$\lambda = 3, 3, 4$$

← a REF

$$T - 3I = \begin{bmatrix} 0 & 1 & 1 \\ 0 & 0 & 0 \\ 0 & 0 & 1 \end{bmatrix} \sim \begin{bmatrix} 0 & 1 & 1 \\ 0 & 0 & 1 \\ 0 & 0 & 0 \end{bmatrix} \Rightarrow \dim(E_{T-3}) = \dim(\ker(T - 3I)) = 1$$

Φ_3

$$T|_{K_3} : K_3 \rightarrow K_3 \text{ linear, } \dim(K_3) = 2$$

$$T|_{K_3} = T|_{K_3} - 3I_3 + 3I_3$$

← nilpotent

→ eigenvector

There exists a canonical basis $\alpha_1 = \{(T|_{K_3} - 3I_2)(x), x\}$ for K_3

$$\text{Such that } [T|_{K_3}]_{\alpha_1}^{\alpha_1} = \begin{bmatrix} 0 & 1 \\ 0 & 0 \end{bmatrix} + 3 \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = \begin{bmatrix} 3 & 1 \\ 0 & 3 \end{bmatrix}$$

Likewise $T_{1k_4}: k_4 \rightarrow k_4$ linear, $\dim(k_4)=1$

$$T_{1k_4} = \underbrace{T_{1k_4} - 4I_3}_{\text{nilpotent}} + 4I_3$$

↙ eigenvector

There exists a canonical basis $\alpha_2 = \{v\}$ for k_4

$$\text{Such that } [T_{1k_4}]_{\alpha_2}^{\alpha_2} = [0] + 4 = [4]$$

$\alpha = \alpha_1 \cup \alpha_2$ is a canonical basis for \mathbb{Q}^3

$$\text{and } [T]_{\alpha}^{\alpha} = \begin{bmatrix} [T_{1k_3}]_{\alpha_1}^{\alpha_1} & \\ & [T_{1k_4}]_{\alpha_2}^{\alpha_2} \end{bmatrix} = \begin{bmatrix} 3 & 1 & 0 \\ 0 & 3 & 0 \\ 0 & 0 & 4 \end{bmatrix} \text{ JCF}$$
